Cybersecurity Intelligence,
Protection, and Holistic
Enterprise Resilience

CIPHER develops a collaborative, standardised, service-based testing facility to strengthen cybersecurity and information assurance in critical sectors.

The project brings together solution providers, essential service operators and auditors to design, test and validate security strategies that support preparedness, resilience and compliance with the EU Cybersecurity Strategy for the Digital Decade.

At the core of CIPHER is an experimentation laboratory enabling pre-emptive security capabilities, real-world validation and continuous improvement of cybersecurity measures.

Through use cases, open validation campaigns and stakeholder engagement, CIPHER ensures that its solutions are tested in realistic settings and shared with relevant ecosystems.
